

Two fields now clear BOTH bars: lower level AND lower accumulation than the draft

Shaded box = both coordinates below the draft's, which is the goal. At 3,500 steps only `direction` was inside; 14,000 steps adds `price\_rel` under BOTH metrics, and its accumulation goes negative (solid line = 0), i.e. the error SHRINKS

● draft (Mamba-3, no DFM) ◆ DFM 3,500 steps ▲ DFM 14,000 steps ■ DFM 14,000 + value metric

42 held-out tickers, 2026-01. Level = excess divergence over the real-vs-real floor at m=440; accumulation = its rise from m=40. Verdicts identical under JS (gate G2).
