

Compound error after the R2/R3 sampling fixes: 487 tickers, 2026-01, held out

Excess divergence over the real-vs-real floor, vs generation depth m . Top row as measured (level + accumulation); bottom row shifted to zero at $m=40$ (accumulation only).

— draft (pretrained Mamba-3, no DFM) — corrected (+ DFM residual, learned) — control (+ residual, random direction) - - - floor (real data vs itself) = 0 by construction

487 held-out tickers, 8 sequences each, 500 generated messages · shaded = 95% CI from ticker-level bootstrap (2000 draws) · symmetric cross-half estimator, entropy-normalised
